

Application of ASTM B150 C63200 material ball valve

The C63200 ball valve, made from an aluminum-bronze alloy, is widely used in industries where corrosion resistance and durability are critical. Its applications include seawater systems, desalination plants, oil and gas pipelines, and chemical processing industries. The valve's ability to withstand harsh environments, including exposure to seawater and chemicals, makes it suitable for marine and offshore operations, as well as industrial settings where long-lasting performance is essential for controlling fluid flow.
